Essential Question How can you use integers to represent the velocity and the speed of an object?

- On these two pages, you will investigate vertical motion (up or down).
- Speed tells how fast an object is moving, but it does not tell the direction.
 - Velocity tells how fast an object is moving, and it also tells the direction.
- When velocity is positive, the object is moving up.
When velocity is negative, the object is moving down.

1 ACTIVITY: Falling Parachute

Work with a partner. You are gliding to the ground wearing a parachute. The table shows your height above the ground at different times.

Time (seconds)	0	1	2	3
Height (feet)	90	75	60	45

- Describe the pattern in the table. How many feet do you move each second? After how many seconds will you land on the ground?
- What integer represents your speed? Give the units.
- Do you think your velocity should be represented by a positive or negative integer? Explain your reasoning.
- What integer represents your velocity? Give the units.

2 ACTIVITY: Rising Balloons

Work with a partner. You release a group of balloons. The table shows the height of the balloons above the ground at different times.

Time (seconds)	0	1	2	3

Key Idea

Absolute Value

Words The **absolute value** of an integer is the distance between the number and 0 on a number line. The absolute value of a number a is written as $|a|$.

EXAMPLE 1 Finding Absolute Value

Remember
A number line can be used to compare and order integers. Numbers to the left are less than numbers to the right. Numbers to the right are greater than numbers to the left.

So, $1 < |-4|$.

Butter	35
Airplane fuel	-53
Honey	-3
Mercury	-39
